### **TEST STRIPS „3 in 1” FOR POOL WATER**

Along with the full range of preparations for maintaining the quality of swimming pool water, ZHIVAS LTD offers some useful and necessary accessories for quick and easy control of the water.

The test strips „3 in 1” are intended for quick and simultaneous determination of chlorine content, pH and total alkalinity.

The kit consists of a container with 50 strips for simultaneous detection of the three indicators in the water of your pool. Every strip has three indicator areas. The measurements are made by soaking the strip in the water for several seconds and comparing the indicator areas to the colored scale on the container. The chlorine level and total alkalinity are measures in parts per million – ppm (mg/l) and the pH level of the water - in pH units.

#### **Instructions for use**

1. Remove one strip from the container. Soak it in the water for three seconds.
2. Take it out and shake off the water. Wait for 30 seconds.
3. Compare the color of the indicator areas on the strip with the color charts on the container and select the best match. The label says which field corresponds to each indicator.
4. For convenience each scale shows the optimal range for each indicator.
5. In case of deviation from the norm in any of the indicators, correct the issue – change the pH, increase or decrease the chlorine level or total alkalinity, by applying the proper agents for the purpose.

#### **Storage**

Store the strips in the tightly closed original container, in a dry and airy room, at room temperature and away from children.
